

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger** →

on Sunday 18 January 2026

Persistent  
weak layer

Snowpack stability: **very poor**

Frequency: **many**

Avalanche size: **medium**

Outside marked and open pistes a precarious avalanche situation will prevail.

Avalanches can over a wide area be released easily. The avalanche prone locations are to be found in all aspects above approximately 2000 m. The avalanche prone locations are numerous. These places are covered with new snow and are therefore barely recognisable, even to the trained eye. Mostly the avalanches are medium-sized. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain, as well as on wind-loaded slopes.

Whumpfung sounds and the formation of shooting cracks when stepping on the snowpack serve as an alarm indicating the danger. Remotely triggered avalanches are possible.

Experience and restraint are important.

## Snowpack

### Danger patterns

dp.5: snowfall after a long period of cold

dp.6: cold, loose snow and wind

The old snowpack is faceted. Over a wide area new snow and wind slabs are lying on a weakly bonded old snowpack. The various wind slabs have bonded poorly with the old snowpack.

## Tendency

Hardly any decrease in avalanche danger. Avalanches can as before be released, even by a single winter sport participant and reach medium size.
